

## Why Neuroscience Only Confuses Things

The insistence of neuroscientists on trying to understand the nature of perception only in terms of the neuronal activity that occurs in the brain only confuses things. Neurons are composed of atoms and molecules, which are composed of elementary particles, which are described by quantum field theory. Can any neuroscientist begin with QFT and explain the neuronal activity in the brain? Of course not. The problem is far too complicated, and yet even QFT is not a fundamental description. The holographic description of the world is more fundamental than QFT. The brain is part of the body which is part of the world, and the quantum state of the world is formulated in terms of qubits of information encoded on a holographic screen. The qubits that describe any object of perception in the world are entangled with the qubits that describe the brain. All objects of perception in the world, including the brain, are forms of information that can be reduced to qubits of information encoded on a holographic screen. All the qubits that describe a holographic world are inherently entangled. The perception of any object always requires disentangling the quantum state of the entire world. This problem is far too complex to be solved only in terms of the neuronal activity of the brain.

The Observer's Holographic Screen

The only way to even approach the problem is to begin with the idea of an observer and its holographic screen, but the observer is only a point of perceiving consciousness that arises at a point of view and that undergoes accelerated motion at the center of its own holographic world. The observer's accelerated motion is what gives rise to its event horizon that becomes its holographic screen when qubits are encoded on its horizon.

Perception always occurs in a subject-object relation, where an object of perception can only be understood as a form of information encoded on the observer's holographic screen. The observer is the subject, which can only be understood as a moving point of illuminating, animating and perceiving consciousness at the center of its holographic world. To even discuss the nature of perception, we have to introduce the idea of the light of consciousness that illuminates that holographic world and projects the images of that world from the observer's holographic screen to its central point of view. The illuminating and projecting light of consciousness that emanates from the observer's point of view at the center of its holographic world is what is disentangling the quantum state of that world with the observer's perception of an object that appears in that world.

All Seeing Eye

For a discussion of how the light of consciousness disentangles the quantum state of the observer's holographic world as the observer makes an observation of anything that appears in its holographic world and as the image of that thing is projected from the observer's holographic screen to its central point of view, see the article: *Why Physicists Cannot Take the Observer Out of Physics*.

Universal Observer

The bottom line is that neuroscience only confuses things. You are the thing that is being confused. You are being confused into thinking that you are something that you can perceive. The neuronal activity in your brain leads to the construction of thoughts in your mind that emotionally construct a body-based personal self-concept. The personal self-concept is always emotionally constructed as a body-based personal self-image is constructed out of memory and is emotionally related to the image of some other thing you perceive in the world. That emotional construction of a personal self-concept leads you to emotionally identify yourself with that personal self-image due to your perception of emotional feelings of self-limitation to the body that arise as the personal self-concept is emotionally constructed in your mind. These emotional expressions are self-defensive in nature, as they not only defend the survival of your body, but they also defend the survival of your body-based personal self-concept. In the sense of Darwinian evolution and the survival of the fittest body, they have been selected for by natural selection over eons of life-times. The construction of self-concerned thoughts in your mind that lead to the emotional construction of a body-based personal self-concept is what the neuronal activity of your brain is all about. This neuronal activity in your brain that leads to the construction of self-concerned thoughts in your mind and the emotional construction of a body-based personal self-concept is confusing you into believing that you are a body.

If you are not a body, then what are you? You are not a body that appears in the world you perceive. You are the perceiver of that world. The only true thing you can know about yourself as you perceive that world is your own sense of being present, which is called *I Am*. The personal self-concept is always emotionally constructed out of the memory of past events or the anticipation of future events as an emotional projection to past or future events, but you do not exist in the past or the future. You exist now, in the present moment. The events you perceive constantly change over the course of time, but your own sense of being present is always the same sense of beingness and presence. That sense of *I-Am-ness* is the only true thing you can ever know about

yourself as you perceive your own world from the center of that world in the present moment. You can only know yourself to be a pure presence of illuminating, animating and perceiving consciousness that is present now, at the central point of view of the world you perceive. You always exist in the *eternal now* of your own timeless being.

Your self-concerned thoughts, emotionally constructed in your mind out of memory, are only confusing you about what you really are. Your body-based personal self-concept is only a false belief that you believe about yourself, which is only believable because of the expression of self-defensive emotional energy that underlies the mental construction of all your self-concerned thoughts that makes you feel emotionally self-limited to the emotionally animated form of your body. The expression of that self-defensive emotional energy always arises from personal bias in your focus of attention. You create your own confusion about what you are due to personal bias in your focus of attention that leads to expression of self-defensive emotions that emotionally constructs your body-based personal self-concept in your mind. As you express self-defensive emotions, you feel compelled to defend the survival of your body as though your existence depends on it. That is the false belief that you believe about yourself. That emotional expression is what the neuronal activity of your brain is all about, which only confuses you into believing that you are a body that appears in the world that you perceive.
